

# RapidIdentity Lifecycle Management in K12 Education

Creating and supporting thousands of student, teacher, staff, and external user accounts with manual processes and scripts is impractical and difficult to manage, especially with frequent user changes and high turnover. RapidIdentity Lifecycle addresses this challenge by automating the entire identity lifecycle, allowing users to manage their accounts and passwords following pre-defined policies.

With RapidIdentity Lifecycle, tasks such as user account creation, location mapping, attribute updates, organizational unit moves, group memberships, and the renaming, disabling, or deletion of accounts can all be automated. Closing gaps in identity and access controls improves security, reduces IT workload, improves the user experience, supports audits and compliance, and fosters a digital environment that helps everyone perform at their best.

## Keep Learning Safe

As digital learning has expanded, educational institutions are increasingly attractive targets for malicious actors. RapidIdentity Lifecycle helps safeguard student data and reduces the risk of data breaches by actively managing all applications and services that contain sensitive information. Automatic deprovisioning helps close security gaps and protects student and staff data.

## Eliminate Repetitive Manual Processes

Automate account creation, changes, and deletion at scale, seamlessly keeping Active Directory and downstream systems accurate and up-to-date. RapidIdentity Lifecycle removes the burden of manually managing group access and streamlines identity management for users with multiple affiliations (such as parent and coach).

## Ensure Day-One Access

Ensure everyone in your education ecosystem receives automated access to the appropriate resources from day one — including students, faculty, parents, staff, contractors, applicants, vendors, substitutes, and external users who may not be part of your authoritative system. This access adapts seamlessly as users change roles, classes, or campuses throughout their lifecycle.

RapidIdentity Lifecycle is designed to address the unique needs of your academic institution with features including:

### **Automated Provisioning and Deprovisioning**

Fully automate the process of identity creation and ensure user accounts are fully managed from cradle to grave.

### **Sponsorship for Third-Party Populations**

Provide the same level of identity lifecycle management for contractors, partners, and other external users who don't exist in your authoritative system.

### **Granular Group Management**

Remove the burden of manually managing group access with support for static and dynamic group assignments, inclusions and exclusions filtering, and nested group memberships.

### **Delegated Administration and End-User Self-Service**

Enable students to reset their own passwords and educators to unlock accounts and reset passwords, right from the classroom.

### **Dynamic Role Management**

Automatically place users in the correct groups and distribution lists, using role and attribute-based provisioning policies to add and remove access rights.

### **Enterprise-Ready Integrations**

Connect authoritative source and target systems (on-premises and cloud-based) with pre- or custom-built connectors using our SDK. Integration options: Text/Flat File (.csv, xml), LDAP (AD, OpenLDAP, Open Directory, eDirectory, etc.), Database (via JDBC), Web Services (SOAP/REST), Command Line Interface (CLI).
